

Ecology + Economy

An environmentally friendly, futuristic coffin.

Kraft Coffin

Cardboard

Made in Japan

Obtained patent for foldable cardboard coffin

Our foldable cardboard coffin has been patented in the United States, the European Union (including the UK at the time of patent acquisition), the People's Republic of China, the Republic of China, and Japan, and is currently undergoing patent application in the Hong Kong Special Administrative Region. Furthermore, the Kraft coffin CKX Flat type is currently undergoing design registration applications in South Korea and Japan.

Lightweight + Load capacity + Water resistance

The Kraft coffin CKX Flat type is lightweight, weighing approximately 12 kg, yet can withstand loads of over 200 kg.

The cardboard surface liner uses highly water-resistant "HYDRO KRAFT Liner," so there's no need to worry about it absorbing moisture and losing its strength. It also complies with Class 2 (weather resistance) of the former US Federal Standard PPP-B-640d, demonstrating its water and weather resistance.

The included waterproof paper that is placed on the bottom is also highly water-repellent and waterproof.

Raw materials

The liner paper used in our cardboard is made from over 95% North American virgin pulp that has been forest certified (SUSTAINABLE FORESTRY INITIATIVE® STANDARD), and the inner liner paper and core of the flute section are a mixture of recycled paper and virgin pulp.

Assembly

To assemble the Kraft coffin CKX, you will need an impact driver and a size 2 Phillips bit. Assembly is possible by one person. Once you understand the steps, it can be assembled in 2-3 minutes.

Features of Kraft coffin

Because it is a paper product, it is highly flammable, which leads to savings in combustion energy by shortening the cremation time (burning time for the coffin alone: approximately 10 minutes).

This shortens the cremation time and reduces the amount of carbon dioxide and other emissions that are emitted during cremation.

The number of coffins that can be produced from 1 cubic meter of wood is about 10 wooden coffins measuring 1,900 mm in length, 550 mm in width, and 400 mm in height, but with Kraft coffins, about 36 can be produced, reducing the amount of wood used to less than one-third and easing the burden on the environment.

The residue left after cremation is much less than that of a wooden coffin.

The folded shape reduces transportation and storage costs.
